

## PATTERN REVERSE KENO GAME METHOD OF PLAY

### ABSTRACT

5 A virtual matrix comprised of a plurality of grid elements is provided, on which a hidden pattern, comprised of a plurality of matrix entries, is randomly placed. A player views a gaming matrix having a plurality of visible positions, each visible position corresponding to one of the grid elements. The player chooses at least one of the plurality of visible positions on the gaming matrix, after which the game displays the corresponding grid element of the virtual matrix on the gaming matrix. Based on the correct number of guesses matching the pattern location, the player is awarded and a media presentation signals the player's success. If the player guesses incorrectly, a second media presentation signals the incorrect guess.
